

NEWSLETTER – 2009 H1

Welcome to this first 2009 edition of our Newsletter, a regular publication with all the latest news from **Damor Engineering Ltd.**

RECENT ACHIEVEMENTS

Keeping us very busy for almost all of the first half of 2009, we have recently completed a major contract to carry out the detailed design and analyses of four support platforms, on which six process skids will be mounted at elevation above the deck of a new-build FSO vessel.

The all-up weight of the heaviest skid & platform assembly is around 180 tonnes and all the skids are elevated by 3.0 m from the ship's deck. Walkways are provided at elevation around each skid, with access from the deck via stairways and emergency escape ladders. The designs and analyses were submitted to ABS for approval before manufacturing works commenced.

For the same client, we carried out a revised assessment of a modified vent tower in March, which carries the vent pipework from the vessel holds to an elevated discharge position high above the foredeck. This required the construction of a new FE model comprised entirely of beam elements, and analyses were

performed under eight separate load case combinations of vessel motion and wind pressures. A basic fatigue assessment also formed part of the scope of works.

QUALITY ASSURANCE SUCCESS !

Our ISO9001 Quality Assurance system underwent its annual external audit by QMS in March, and for the fourth year running we received no non-conformance notices nor even a single minor observation.

FUTURE OPPORTUNITIES

Damor Engineering Ltd has recently been awarded a contract to carry out the structural verification of a skid-mounted pig launching vessel for an international gas pipeline project.

Additionally, we are currently assisting a major international engineering contractor with an independent technical review of project progress and forecast production levels for the refinancing of a new aluminium smelter in the middle-east.
